

Y86 Introduction

- Topic:
 - What is the y86?
 - Why are we learning about it?
 - What is its visible state?
- Learning outcomes
 - Identify the basic components of a processor
 - Describe the y86 processor in terms of its fundamental components.
- Reading
 - Bryant and O'Halloran: Chapter 4 through section 4.1.2 & 4.1.4

Much of this material is derived from that of Bryant and O'Halloran.

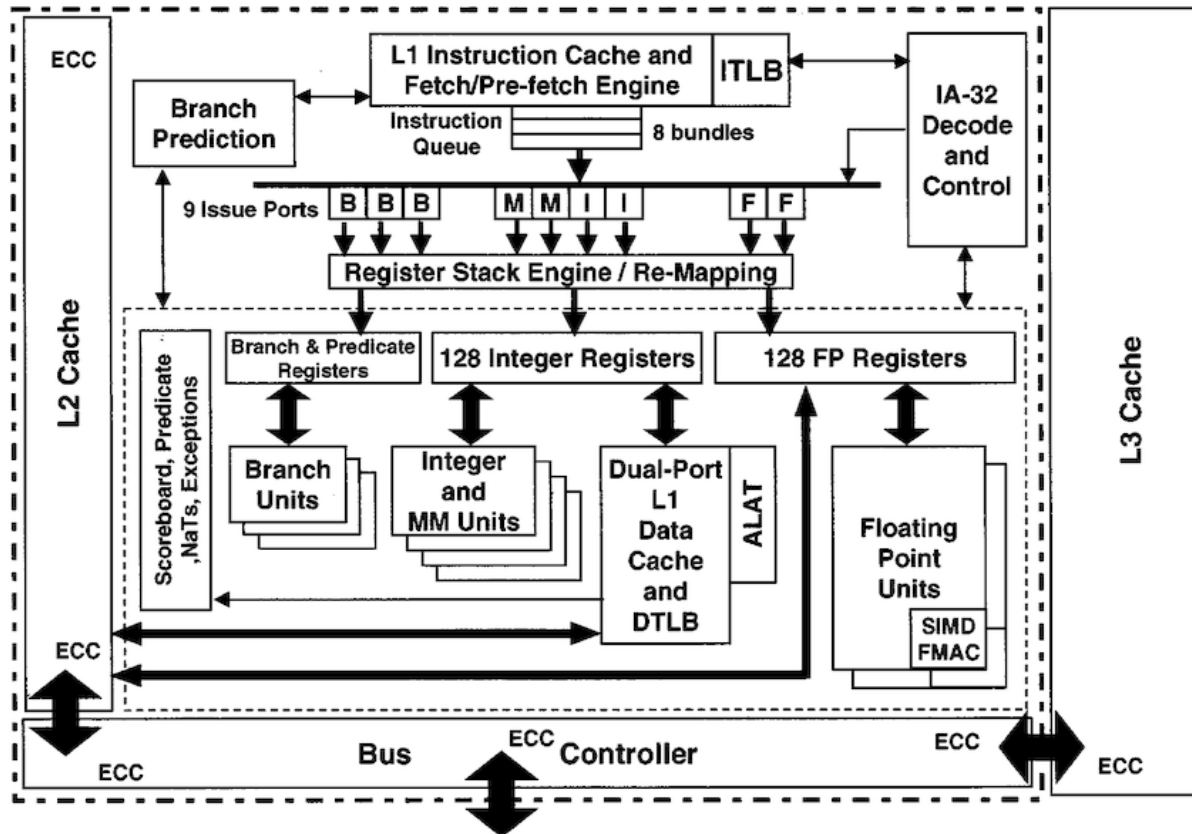

The Artist's Rendition of a CPU

CPU

From *Computer Systems: A Programmer's Perspective*

A Modern CPU

The y86 Processor

Registers (RF: Register File)

%rax	%rsp	%r8	%r12
%rcx	%rbp	%r9	%r13
%rdx	%rsi	%r10	%r14
%rbx	%rdi	%r11	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Program visible state

- Referenced by the ISA
- Used in assembly programs
- Actual implementation can have lots of other things

The y86 Processor – Registers

Registers (RF: Register File)

%r0	%r4	%r8	%r12
%r1	%r5	%r9	%r13
%r2	%r6	%r10	%r14
%r3	%r7	%r11	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Registers:

- **High performance storage used to manipulate data**
- **Processors often execute instructions in a single cycle; accessing memory can take 10's or 100's of cycles.**
- **Most processors have a few tens of registers.**
- **The y86 has 15 64-bit registers.**

The y86 Processor – Registers

Registers (RF: Register File)

<code>%rax</code>	<code>%rsp</code>	<code>%r8</code>	<code>%r12</code>
<code>%rcx</code>	<code>%rbp</code>	<code>%r9</code>	<code>%r13</code>
<code>%rdx</code>	<code>%rsi</code>	<code>%r10</code>	<code>%r14</code>
<code>%rbx</code>	<code>%rdi</code>	<code>%r11</code>	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Registers:

- Some registers have designated purposes, e.g., `%r4` is also called `%rsp` which is used as the stack pointer.
- Register `%r15` is invalid

The y86 Processor – Condition Codes

Registers (RF: Register File)

%rax	%rsp	%r8	%r12
%rcx	%rbp	%r9	%r13
%rdx	%rsi	%r10	%r14
%rbx	%rdi	%r11	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Condition Codes:

- A collection of bits set by arithmetic and logical instructions (ALU operations)
- ZF: Zero-flag: The last ALU operation produced a 0
- SF: Sign-flag: The last ALU operation produced a negative number
- OF: Overflow-flag: The last ALU operation produced an overflow

The y86 Processor – Status

Registers (RF: Register File)

%rax	%rsp	%r8	%r12
%rcx	%rbp	%r9	%r13
%rdx	%rsi	%r10	%r14
%rbx	%rdi	%r11	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Program Status Register

- Indicates normal operation or an error condition
- 1: AOK Normal Operation
- 2: HLT Halt Instruction encountered
- 3: ADR Bad address encountered
- 4: INS Invalid instruction encountered

The y86 Processor – PC

Registers (RF: Register File)

%rax	%rsp	%r8	%r12
%rcx	%rbp	%r9	%r13
%rdx	%rsi	%r10	%r14
%rbx	%rdi	%r11	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Program Counter (PC)

- Indicates the address of the **next** instruction to execute

The y86 Processor – Memory

Registers (RF: Register File)

%rax	%rsp	%r8	%r12
%rcx	%rbp	%r9	%r13
%rdx	%rsi	%r10	%r14
%rbx	%rdi	%r11	

Condition Codes (CC)

ZF	SF	OF
----	----	----

Stat: Status Register

PC: Program Counter

DMEM:
Memory

Memory (DMEM)

- You think of this as “main memory” or “How much DRAM my machine has”
- Byte-addressable storage array
- Words stored in **Little Endian** order

Y86 Instruction Classes

- **Simple instructions:** `halt`, `nop`
- **Move instructions:** `rrmovq*`, `irmovq`, `rmmovq`, `mrmmovq`
- **Stack operations:** `pushq`, `popq`
- **Arithmetic and Logical operations:** `addq`, `subq`, `andq`, `xorq`
- **Jump instructions:** `jmp`, `jle`, `jl`, `je`, `jne`, `jg`, `jge`
- **Function call and return instructions:** `call`, `ret`

1-byte instructions

2-byte instructions

9-byte instructions

10-byte instructions

Simple Instructions

halt

Set program status register to HLT

nop

Do nothing
