

CPSC 304: Introduction to Relational Algebra

Normalization 2 In-Class Exercise Solution

Consider a relation $S(G, H, J, K)$. The following FDs are given:

$G \rightarrow H$

$JK \rightarrow G$

$H \rightarrow K$

Is S in BCNF? Why or why not?

If it is not in BCNF:

- Decompose into BCNF as covered in class.
- Circle the relations in your final answer.
- Underline the keys in your final answer.

Show your work. Write your answer here:

Closures:

$G^+ = \{G, H, K\}$

$JK^+ = \{J, K, G, H\}$

$H^+ = \{H, K\}$

$G \rightarrow H$ violates BCNF (as does $H \rightarrow K$ and $G \rightarrow K$), so pick one to decompose on. We arbitrarily choose to decompose on $G \rightarrow H$. (Note: if you chose to decompose on $H \rightarrow K$ or some other FD that violates BCNF first, you will get a different answer. That's fine.)

Step 1: Decompose on $G \rightarrow H$.

$R_1(\underline{G}, H), R_2(\underline{G}, J, K)$

R_1 is in BCNF (all two attribute relations are in BCNF).

Step 2: Decompose on $G \rightarrow K$. (The closure of G tells us that $G \rightarrow H$ and $G \rightarrow K$.)

In R_2 , $G \rightarrow K$ violates BCNF, so you need to decompose again

$R_3(\underline{G}, K), R_4(\underline{G}, J)$

We cannot decompose on $JK \rightarrow G$ or $H \rightarrow K$ because out of R_1, R_3 , and R_4 , there is no single relation that contains all of JKG or HK .

The **final answer** is: $R_1(\underline{G}, H), R_3(\underline{G}, K), R_4(\underline{G}, J)$.
